this volume contains the papers presented at the third biennial information systems foundations theory representation and reality workshop held at the Australian National University in Canberra from 27-28 September 2006. The focus of the workshop was as for the others in the series: the foundations of information systems as an academic discipline. The particular emphasis was as in past workshops: the adequacy and completeness of theoretical underpinnings and the research methods employed at the same time the practical nature of the applications and phenomena with which the discipline deals were kept firmly in view. Accordingly the papers in this volume range from the unashamedly theoretical in their focus (designing for mutability in information systems artifacts) towards a unified theory of fit task technology and individual to the much more practically oriented an action-centred approach to conceptualising information support for routine work.

Human-Computer Interaction and Management Information Systems Foundations offers state-of-the-art research by a distinguished set of authors who span the MIS and HCI fields. The original chapters provide authoritative commentaries and in-depth descriptions of research programs that will guide 21st-century scholars, graduate students, and industry professionals. Human-Computer Interaction or Human Factors in MIS is concerned with the ways humans interact with information technologies and tasks, especially in business, managerial, organizational, and cultural contexts. It is distinctive in many ways when compared with HCI studies in other disciplines. The MIS perspective affords special importance to managerial and organizational contexts by focusing on analysis of tasks and outcomes at a level that considers organizational effectiveness with the recent advancement of technologies and development of many sophisticated applications. Human-centeredness in MIS has become more critical than ever before. This book focuses on the basics of HCI with emphasis on concepts, issues, theories, and models that are related to understanding human tasks and the interactions among humans, tasks, information, and technologies in organizational contexts in general.
